Andrey Hlipalo

Java/Kotlin backend developer, 5+ years

Tbilisi, Georgia

Summary

I'm a Java/Kotlin Backend Developer with 5+ years of experience buildinghigh-load microservice platforms in regulated environments — healthcare(18M users, SLO 99.9%) and banking.My focus is designing reliable distributed systems: exactly-once delivery,latency optimization, and zero-downtime deployments. I own backend servicesend-to-end — from architecture reviews and code design to observability,incident response, and mentoring junior developers.Key results I'm proud of:• Reduced p95 latency of an I/O-bound endpoint from 2.4s to 0.9s by migrating to Java 21 Virtual Threads (confirmed by load testing)• Cut read-endpoint p95 latency from 120ms to 45ms and PostgreSQL calls by 60% through Redis caching• Accelerated Elasticsearch search over 50M documents: p95 from 820ms to 210ms, aggregations from 11s to 1.9s• Implemented exactly-once event processing in Kafka: Transactional Outbox, idempotent producers/consumers, DLQ, ID-based deduplication• Standardized CI/CD with Helm and GitFlic: releases cut from 2h to 15min, new service bootstrap from 1 day to 40min• Reduced report-generation RAM usage by 90% (8 GB → 800 MB), eliminating OOMCore stack: Java 11/17/21, Kotlin, Spring Boot, Spring Data JPA, Hibernate,PostgreSQL, Redis, Elasticsearch, Apache Kafka, RabbitMQ, Docker, Kubernetes,Helm, Prometheus, Grafana, EFK, CI/CD.

Experience

Облачные технологии

Java Software Engineer

September 2024 - Present (2 years 1 month)

Rostov

EMMAC — digital healthcare platform: 18M users, 1,000+ institutions. Owned 5 backend microservices within a team of 5 backend + 4 frontend developers, QA, and DevOps. Mentored 2 junior developers and defended architectural decisions at review boards.

Reliability & observability:
• Designed and defended architecture for 5 microservices: Transactional Outbox, exactly-once Kafka, caching
• Set up health checks, Prometheus/Grafana metrics, SLI alerts for latency, error rate, and consumer lag; took part in incident analysis and MTTR reduction
• Implemented exactly-once processing for critical Kafka events with idempotent producers, transactions, acks=all, retries, DLQ, and ID-based consumer deduplication

Performance:
• Migrated I/O-bound data fetching (EHR/EMR sources) to Java 21 Virtual Threads: p95 latency dropped from 2.4s to 0.9s at 30 parallel requests
• Reduced read-endpoint p95 latency from 120ms to 45ms and PostgreSQL calls by 60% via Redis caching of reference data
• Sped up Elasticsearch search over 50M documents: p95 from 820ms to 210ms,
aggregations from 11s to 1.9s
• Optimized PostgreSQL queries: p95 from 380ms to 210ms after fixing N+1 issues and adding B-tree indexes (verified via EXPLAIN ANALYZE)

Delivery:
• Standardized CI/CD pipelines with DevOps: Helm charts, liveness/readiness probes, GitFlic pipelines. Release time: 2h → 15min; new service setup: 1 day → 40min; rollback: 20min → 3min

Stack: Java 17/21, Spring Boot, Spring Data JPA, PostgreSQL, Redis, Elasticsearch, Apache Kafka, RabbitMQ, Docker, Kubernetes, Helm, Prometheus, Grafana, EFK, GitFlic CI/CD.

Center Invest IT
Java/Kotlin Developer
July 2022 - June 2024 (2 years)
Ростов-на-Дону

Built integration modules for banking business processes: a loan application service and a QR-code payment service (~10,000 active users). Team of 4 backend developers, 2 QA, and an analyst.

• Implemented distributed transaction integrity: Saga orchestration, unique

transaction keys in PostgreSQL, compensating actions, and idempotent handlers — duplicate loan applications were fully eliminated after rollout
• Reduced RAM consumption from 8 GB to 800 MB (-90%) for L5 report generation (~1.5M rows): replaced batch Hibernate extraction with streaming JDBC (fetchSize=1000), batch limits, and context clearing — eliminated OOM errors; diagnosed via JProfiler and heap dumps
• Cut standard integration development time from 5 days to 2 by packaging internal RabbitMQ and Kafka libraries as reusable Maven modules

Stack: Java 17, Kotlin, Spring Boot 2.7, PostgreSQL, Spring Data JPA/ Hibernate, JDBC, Apache Kafka, RabbitMQ, JProfiler, Maven.

Inxeria Software
Android/Backend Developer
August 2022 - March 2023 (8 months)
Taganrog

Payment and order management platform for restaurants and cafes: 300+ venues, ~50,000 transactions per day. Team of 6 backend developers, DevOps, QA, and an analyst.

• Raised test coverage from ~30% to 80% (JUnit 5/Mockito unit tests, Testcontainers integration tests); regression bugs per release dropped from 10–12 to 2–3
• Built adapters for integrating 5+ types of restaurant terminals via REST API; connecting a new terminal type went from 2 weeks to 3 days
• Implemented the backend API for the CityCheers mobile app (~20,000 downloads)

Stack: Java 11, Spring Boot, PostgreSQL, Docker, REST API, JUnit 5, Mockito, Testcontainers, Kotlin.

Education

Южный Федеральный Университет (бывший Ростовский Государственный Университет)
Бакалавр, Прикладная информатика · (September 2022 - June 2026)
